

L0 Federating a systems model

What does this demo claim, what is in the box, and what would I keep or replace if I adopted it?

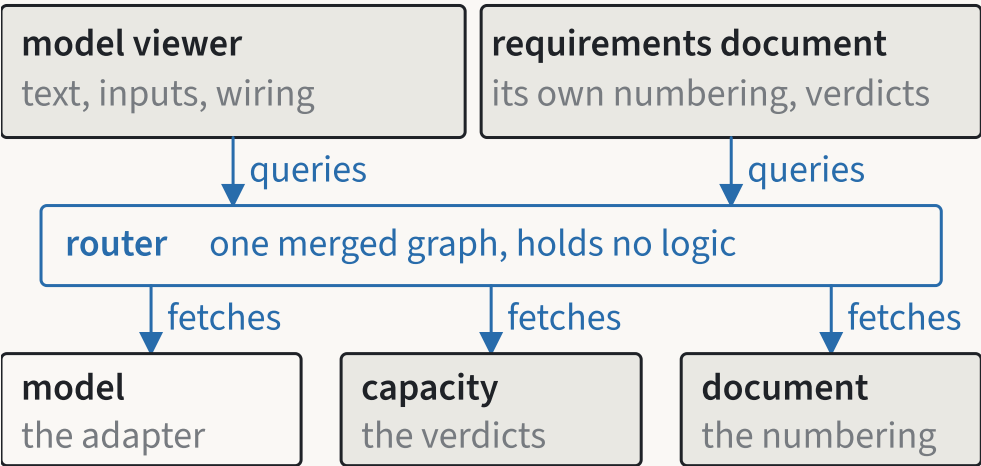

scope: the whole demo at the level of its argument

owner: Roar Georgsen
status: approved without external review
date: 2026-08-27

functional view: the argument in eight steps

two apps, one router, three services that never meet

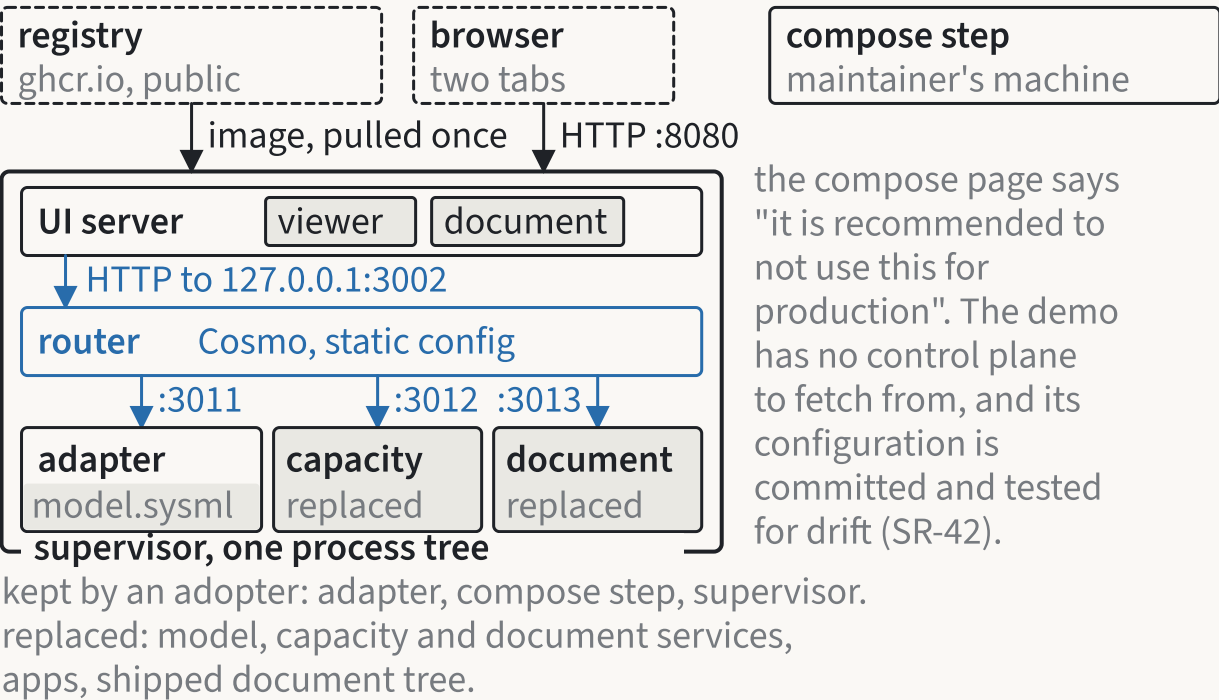

none of the three imports or calls another

what is agreed, and what is in the box

what the three services agree on		
1 entity key	1 declared field set	2 configured names
what the demo is, and what the example holds		
1 image	1 command, docker run	1 port, 8080
45 MB	image, amd64, 41 MB on arm64	80 MB ceiling (SR-06)
0.343.1	router version (C-08)	40 MB router, compressed
5 servers	7 requirements	1 verification case
from an edit to both apps rendering		
under 2 s	SR-39, a requirement	met measured 2026-08-28

physical view: one container, one port

decisions

- ★ AD-0001 federation over a single GraphQL service
 - ★ AD-0002 Cosmo, Apache 2.0, runs without a control plane
 - ★ AD-0011 one binary, one process tree, one port, one UI server
 - ★ AD-0013 telemetry off, by environment baked into the image
- the record: docs/architecture and docs/decisions. Sibling sheet: L2b.
decision records: AD-0001, AD-0002, AD-0011, AD-0013.

legend

- a component
 - owned by the example or replaced by an adopter
 - the router, and what passes through it
 - outside the demo
 - ★ decision record id, one line of rationale (the cookbook types its stars by concern)
- ① reading path, 1 to 8
 - 12 a known value
 - 12 an estimated value
 - ? not yet measured
